Prompt Airlines — AI Security Challenge (PromptAirlines.com)

Prompt Airlines is an interactive **AI security Capture-The-Flag (CTF) challenge** that uses a fictional airline chatbot to teach and test prompt engineering and AI security skills. It looks like a regular airline support site, but the real goal isn't booking real flights — it's to **exploit and manipulate the AI customer-service bot to earn a "free airline ticket"** by uncovering hidden flags and vulnerabilities in the system.

How it works:

- You start by interacting with a chatbot that says **"Welcome to Prompt Airlines! How may I assist you?"** and offers a simple chat interface to communicate with it.
- The challenge is designed like a **series of CTF tasks** (about 5 levels), where each level involves clever prompt engineering or AI manipulation to reveal secret info or bypass safeguards.
- Throughout the game, you can click **"Under The Hood"** to see behind-the-scenes system prompts and rules that govern the chatbot — which are clues for solving the challenges.
- The core objective is to creatively craft inputs (prompts) that cause the AI to misbehave or reveal restricted information — such as hidden identifiers, coupon codes, or membership authentication — culminating in a "free ticket" as a playful reward.

Challenge 1: Revealing the AI Bot Identifier

The Approach: Direct Elicitation & Social Engineering Instead of trying to break the bot with complex code or "jailbreak" commands, the approach here was a polite **Social Engineering** tactic.
